

What do you love most about computing?

I love that this is an ever evolving field that always offers something new and is constantly changing. It thus prevents stagnation as there's always a more efficient way that is yet to be discovered and I am all for it provided said progress comes at little to no harm to people.

If you could meet any scientist or engineer who died before A.D. 2000, whom would you choose, and why?

It would be Nikola Tesla. To inform him of open sourcing in order to prevent some of his most innovative concepts from being just locked away by governments and corporations in an effort to block innovation in favor of profit. When the free market of ideas is compromised, open source is the way.
